This system wasn't sounding good yet, but they had a pair of oil-filled 200 watt triode amps for \$59,000 (set of 4 pieces). These types of systems, where you have outrageously expensive electronics driving modestly priced (Legend? Triangle? Neliiii, I forget the name of these, didn't they change their name a few years ago?) speakers, are great to show off the speakers. But for me, all I heard was the speakers, which, although interesting at their price point, is not what I would be driving with \$60K (excuse me, \$59K) amps.

More pictures of the amps. There was hot things (tubes?) in that liquid and you could see eddies in the as the hotter fluid moved up and away from the heat source. If you squinted real hard you could swear these eddies were really fish swimming around in there. Maybe next year...
